## High-pressure type Mexican folding container for tunnels

What is a tunnel shipping container?

Tunnel containers provide two access points, they have two sets of standard double-doors (one at each end of the container) making it easy to access both ends of the shipping container.

Tunnel Shipping Containers are typically purchased by clients who want improved access to the contents of their container.

Can high-pressure water transmission tunnels withstand creep deformation?

This article proposes an innovative structure that can effectively enhance the robustness of high-pressure water transmission tunnels crossing faults against creep deformation, enabling long-term stable operation of an engineering project.

Can high-pressure water transmission tunnels cross active faults?

An MFL structure suitable for high-pressure water transmission tunnels crossing active faults was proposed. The research confirmed the rationality and feasibility of this new tunnel lining combination structure, providing a feasible direction for the structural design of high-pressure water transmission tunnels to cope with fault creep deformation.

Can a tunnel container be partitioned?

For example a standard tunnel container, i.e. a 20ft container with double doors at each end could be partitioned down the middle, leaving two 10ft x 8ft x 8ft 6" halves - each with their own access - one half could then be converted and used for office space and the other half used for secure part/equipment storage.
